# Step 1: Download The ISO Image

To get a copy of CentOS 7 download from [its source mirror](#). CentOS 7 is now shipping for 64 bit platforms, and currently there is no 32 bit ISO image. This is primarily due to the fact that most servers in production are 64 bit.

# Step 2: Make A bootable Driv

After you have downloaded the ISO image, make a bootable USB drive. Since Centos 6.5, you can create usb drive bootable by simply transferring iso file to usb using dd command. [Win32DiskImager](#) is an alternative solution as we found Unetbootin no longer works for CentOS 7.

```
# dd if=/iso/CentOS-7-x86_64-DVD-1602-99.iso of=/dev/sdb
```
